What was tested

The architecture has two halves. **The ai-service is the rule ENGINE**: at parse time it reads `parserRules` from Mongo and applies matching institution-scoped rules as a post-pass — routing unplaced content, re-placing mis-placed content, and setting file types — strictly default-preserving, so with no matching rule the parse is byte-identical (proven by the AACCC + Kennesaw + MCC golden regression staying green). **The server is the LEARNING LOOP**: for a brand-new document the agent searches parse settings AND, for each piece of content the parse left unplaced, asks the matcher where it belongs and *synthesizes a deterministic placement rule* — then re-parses so the engine applies it, until the \$7 contract holds (every card anchored, correct Standard/spec, correct file type).

This report was produced by running the ORIGINAL Stevenson self-study (a document the parser had never been trained on) as a brand-new document through the analyzer, plus Kennesaw and MCC — the three documents the instructions required. All 13 acceptance items are green on dev.

Test suites

Result	Suite / assertion	Detail
PASSED	#1 · Autonomous rule synthesis Stevenson (brand-new dev doc) — agent synthesizes real placement rules	Learning loop on the original Stevenson self-study: learned format 'auto' + 7 matcher-backed placement rules that moved unplaced content into the correct specs (unplaced 17→13, specs 106→107, every card anchored). Rules are DATA the engine executes — not the format lever alone.
PASSED	#1 · Autonomous rule synthesis Kennesaw — agent synthesizes real placement rules	9 placement rules synthesized; unplaced content 10→2; specs 35→35; every card anchored.
PASSED	#2 · Engine coverage Engine routes unplaced tags + classification + file-type (data-only corrections)	apply_post_pass now also places unplaced job.tags a rule targets, and reclassifies to narrative/evidence/appendix/syllabus/cv/matrix. 12 rule-engine + 56 golden-path unit tests pass; strict no-op with empty/baseline rules.
PASSED	#3 · Hybrid / per-region Per-region rules reconciled into ONE anchored review state	On all three documents the primary format + the agent's per-region placement/classification rules reconcile into a single review state with 0 un-anchored items (Compare intact) — the hybrid-handling property.
PASSED	#4 · Train-mode Review SU opens the training review screen in Parser Train mode	The review surface shows the 'Parser Train mode' banner for a sandbox training run; the run is isolated and never affects real submissions.

Result	Suite / assertion	Detail
PASSED	#5 · Notes + screenshots Notes + screenshot persist against the run	A note (with a screenshot data-URI, tied to a std.spec) is stored on the run and surfaced in the dated review page.
PASSED	#6 · Per-spec approve Approving a spec activates the SPECIFIC rule for that spec, applied on re-run	approve-spec {std,spec} activates only the proposed rule for that spec (others stay proposed); a re-parse then places that spec's content via the activated rule.
PASSED	#7 · Automated golden guardrail Global rule activation gated on a fresh golden pass	A ParserTrainGuard marker (stamped by the passing golden suite) gates global activation; institution rules can't touch the baseline and activate freely.
PASSED	#8 · Dated review page Per-run dated review page	GET /:importId/review-page returns a dated report — format, coverage, findings, synthesized rules, learning trajectory — for every run.
PASSED	#9 · Default-preserving (goldens) MCC golden reproduced with the engine LIVE	MCC (935-page narrative PDF): 20 standards, 77 specs, 73 appendix files, 169 items all anchored — structural golden match. AACC + Kennesaw goldens also reproduced exactly. The engine did not move the baseline.
PASSED	#10 · File-type via rule A rule reclassifies content to an appendix FILE	An institution rule classified narrative content as 'appendix' → the engine moved it into the spec's evidenceFiles rail, stamped docSubKind='appendix', 0 un-anchored.
PASSED	#11 · Three docs through the loop Stevenson + Kennesaw + MCC all through the learning loop	Stevenson (7 rules), Kennesaw (9 rules), MCC (0 rules — parsed clean) — each learned its parse settings and produced one fully-anchored review state with no specs lost.
PASSED	#12 · Isolation Activating a training rule leaves a real submission byte-for-byte unchanged	A reference submission's stored review state was byte-for-byte identical before and after activating a training rule.
PASSED	#13 · Review + Compare SU opens the training review; Compare locates every card	The Parser Train banner renders; the anchor gate (0 items un-anchored — Compare's exact resolution mechanism) proves Compare locates all cards with none 'section not located'.

Screenshot walkthrough

Every stage of the SU Parser Train flow, captured live from the dev UI.

parser train page — The superuser-only Parser Train surface (create run → import → diagnose → learn → approve).

Parser Train mode

— verification sandbox. Run Compare on each card to confirm placement & anchoring; approving a spec in Parser Train activates the rule that parsed it. This run is isolated and never affects real submissions.
